

HearSay Author User Guide

Build class dictionaries · test speech · export NVDA add-ons for students

June 2026

HearSay helps course authors make science and math content pronounceable by screen readers — without asking students to edit personal dictionaries.

Use the web app or Chrome extension to edit a shared class dictionary in Supabase, preview how NVDA-style speech will sound, and download an NVDA add-on plus student install PDF for your class.

What HearSay includes

- Home — overview and links to every tool.
- Screen Reader Lab — paste or pull course text and compare default screen reader speech vs your class dictionary.
- Dictionary — connect to Supabase, edit pronunciation rows, import CSV, and export student files.
- Chrome extension — same Lab and Dictionary in a side panel while you browse your LMS or Google Docs.

Connect once (& Connect)

Most authoring features need your team Supabase project. Click & Connect and enter the project URL and anon key (shared privately with your team — never commit these to a public repo).

Credentials are stored in this browser only. The top navigation shows Connected · your-class when linked.

If you used the legacy Dictionary Builder, HearSay can migrate those saved credentials automatically.

Without a connection you can still use the offline Demo dictionary in Screen Reader Lab and browse the Dictionary UI, but saving, pulling classes, and exports require Connect.

Screen Reader Lab

Paste plain quiz or reading text — from Google Docs, Word, Canvas, or elsewhere. HearSay normalizes subscripts, superscripts, and glued variables (for example $q_{\text{calorimeter}}$).

Two speech columns update live as you type:

- Default screen reader — what NVDA reads with no speech dictionary (factory symbol table at level “most”: parentheses, slash, degrees, equals, etc.). Blue highlights show spelled-out symbols.
- Default + dictionary — your saved class terms applied on top. Green = class dictionary; blue = default only where your class has no rule.
- Use %¶ Hear on each column to listen. While playback runs, use #⏸ Pause
- Flagged tokens — a list of words where pronunciation changes. Click highlighted speech to jump to a token. In the extension you can edit a flagged term inline.

- Pick a class from the dropdown: Demo dictionary (offline chemistry sample) or your Supabase class after Connect.
- Try Load sample for a calorimetry example. Clear resets the editor.

Google Docs equations sometimes lose their fraction bar on copy. HearSay detects glued fractions and inserts “divided by” so speech stays consistent.

Dictionary editor

The Dictionary page is where authors maintain pronunciation rules stored in Supabase entries for each class.

Classes

- Demo dictionary — read-only offline sample; good for exploring Lab speech.
- Course dropdown — pick your class after Connect.
- + Add class — create a new slug (e.g. chem114). Choose starter terms or start empty.
- Edit class — change display name and file prefix (slug is permanent).
- Delete class — removes the class from Supabase (with confirmation).
- Pull — reload all classes and rows from the cloud.
- Save class — save all rows again with confirmation (table edits also auto-save).

Terms table

- Pattern — exact text students see (e.g. "T, mL, J/g°C).
- Spoken — how the screen reader should say it (e.g. delta T, milliliters).
- Note — optional reminder for authors; included in NVDA export comments.
- Ignore case — NVDA dictionary setting (Yes/No).
- %¶ on each row — hear that row before saving.
- ' — delete a row (confirms, then saves).
- Edits in the table auto-save to Supabase and refresh Screen Reader Lab for that class.
- Search — filter by words (all terms must match). Use '!' or Enter to jump

Add terms

- Use the Add pronunciation form, or Import CSV (download Template CSV first).
- Starter terms — when creating a class, pick a starter bundle, copy from another class, or browse the category catalog.
- %¶ Hear on the add form tests speech before you add a row.

Download for students

From Dictionary, open Download for students. Share the .nvda-addon file and the install PDF with your class.

- NVDA add-on (.nvda-addon) — recommended. Students on Windows with NVDA 2026.1+ usually double-click to install, then restart NVDA.
- Install PDF — generated alongside the add-on; includes alternate install (Install from external source).
- NVDA .dic — raw dictionary file for advanced NVDA users.
- JAWS source TSV and Apple VoiceOver CSV — optional formats for other screen readers.

- Include NVDA regex rules — covers units after numbers (e.g. 10 mL) and patterns like parenthetical J/g°C.
- Add-on settings — set version, add-on ID, summary, and author. Bump Version when you redistribute an update.

Chrome extension

Install from the home page: download hearsay-chrome-extension.zip, extract it, open chrome://extensions, enable Developer mode, Load unpacked, and select the extracted folder (not the zip).

- Pin HearSay from the puzzle icon, then click the toolbar icon to open the side panel.
- Tabs: Screen Reader Lab and Dictionary — same tools as the website.
- & Connect once in either tab (shared credentials).
- Pull from page (Lab tab) — select text on the active browser tab (LMS page, syllabus, quiz) and pull it into the Lab editor.
- Switch between Lab and Dictionary without losing your Connect session.

Typical author workflow

- 1 Click & Connect and pick or create your class in Dictionary.
 - 2 Add terms manually, import CSV, or use Starter terms when creating a class.
 - 3 Open Screen Reader Lab, select your class, paste sample quiz text (or Pull from page in the extension).
 - 4 Listen with %¶ Hear. Fix terms in Dictionary until green highlights match.
 - 5 Download the NVDA add-on and install PDF from Dictionary!
 - 6 Download
- Share both files with students. They install once per computer; no Canvas changes required.

Tips and troubleshooting

- Demo dictionary vs class — Demo is offline and read-only. Your real class rows live in Supabase after Connect.
- Not connected — Save, Pull, Add class, and exports show a message and silently.
- Screen Reader Lab shows combined speech (default + dictionary), not raw NVDA substitution alone.
- Chemistry bundled rules — Demo includes bundled chemistry pronunciations. Real classes use only their saved rows plus optional regex rules.
- Test before sharing — use Lab with your class loaded, then spot-check the install PDF samples (kJ/mol, 10 mL, J/g°C).
- Team privacy — treat the Supabase anon key like a team password; use Row Level Security appropriate for your project.
